

For an enemy up there, you could be like a sitting duck.

With AirSniper™, sitting duck is the other guy.

AirSniper™ is a VTOL combat mini UAV intended for close infantry support. In essence, it is a gun with wings.

It can operate either as an autonomous UAV, or it can be controlled remotely as a stand-off weapon. And after removing wings and replacing underbelly camera with a hand grip, it can double also as an assault rifle.

Our patent pending "tilt and stop" rotor design concept gives **AirSniper™** hovering performance and agility of helicopters, with speed and endurance of fixed wing airplanes. And the quad rotors give it superb attitude control capability for precise aiming at any flight speed.

The whole system with GCS weighs less than 35 lbs, can easily fit in a standard infantry back-pack, and is as simple to use as a computer game.

AirSniper™. Because the enemy has guns too!
